TABLE OF CONTENTS

FOREWORD	xi
PROGRAM COMMITTEE	xv
KEYNOTE LECTURE	xxi
FULL PAPERS	
BUILDING SOCIAL APPLICATIONS WITH AN AGILE SEMIO-PARTICIPATORY APPROACH <i>Vânia Paula de Almeida Neris, Heiko Horst Hornung, Leonardo Cunha de Miranda, Leonelo Dell Anhol Almeida, M. Cecília C. Baranauskas</i>	3
DEVELOPING THE INFORMATION CULTURE INDEX: HOW TO MEASURE THE CITIZENSHIP ON THE INTERENT <i>Heein Yang, Eunjung Kim and Doojin Choi</i>	11
CONTENT INTEGRITY PROTECTING SYSTEM <i>Yoshiyasu Takahashi, Anh-Thi Huynh, Ryu Ebisawa, Takaaki Yamada, Jean-Luc Dugelay and Seiichi Susaki</i>	20
A STUDY OF THE SECOND-LEVEL DIGITAL DIVIDE IN RURAL TAIWAN <i>Hsien-Cheng Wang, Lola C.P. Chen and Ming-Chieh Hsu</i>	28
IDENTIFYING THE LINKS BETWEEN ICT AND IMMIGRATION ON THE WEB <i>Jasmina Maric</i>	36
INTELLIGENT GOVERNMENT AND WEB 2.0 <i>Johan van Wamelen and Dennis de Kool</i>	43
THE DEPLOYMENT OF E-GOVERNMENT IN THE HASHEMITE KINGDOM OF JORDAN: FACTORS IN E-GOVERNMENT ADOPTION <i>Mohammad Kamel Alomari, Peter Woods and Kuldeep Sandhu</i>	51
DESIGNING E-GOVERNMENT SYSTEMS FOR ALL – A CASE STUDY IN THE BRAZILIAN SCENARIO <i>Vania Paula de Almeida Neris and M. Cecilia C. Baranauskas</i>	60
SOCIAL ACCESS CONTROL FOR MOBILE-CENTRIC SOCIAL NETWORKS <i>Marijke Coetzee</i>	68
EXTENDING THE BASIC TAGGING MODEL: CONTEXT-AWARE TAGGING <i>Christoph Trattner and Denis Helic</i>	76

SOCIAL MEDIA ARE HIGHLY ACCESSIBLE MEDIA <i>Rogier Brussee and Erik Hekman</i>	84
ENABLING SEMANTIC SEARCH IN STRUCTURED P2P NETWORKS VIA DISTRIBUTED DATABASES AND WEB SERVICES <i>Maria Teresa Andrade and Asdrúbal Costa</i>	92
CONTRIBUTION GRAPHING: A METHOD FOR ANALYZING CO-CONSTRUCTED KNOWLEDGE IN ONLINE ADVICE DISCUSSIONS <i>Nick V. Flor</i>	101
“NO PLACE TO HIDE”-PRIVACY BREACH THROUGH STRUCTURE ANALYSIS OF MULTIPLE SOCIAL NETWORKS <i>Dan Hong and Vincent Y. Shen</i>	109
INTERACTION WITH ART MUSEUMS ON THE WEB <i>Max Arends, Doron Goldfarb, Dieter Merkl and Martin Weingartner</i>	117
THE VALUE OF ONLINE NEWSPAPERS’ WEB 2.0 ADOPTION <i>Soley Rasmussen</i>	125
IMPROVING TAG RECOMMENDATIONS IN SOCIAL BOOKMARKING SYSTEMS: A PRELIMINARY STUDY <i>Domenico Gendarmi and Filippo Lanubile</i>	133
FROM THEORY TO PRACTICE – A REALITY CHECK ON ENTERPRISE MASHUPS <i>Daniel Dahl</i>	141
RESPONDING TO QUESTIONNAIRES ON THE WEB USING XWQUEST <i>José Paulo Leal</i>	149
A RESOURCE-ORIENTED MARKUP LANGUAGE FOR THE RAPID CREATION OF LOOSELY COUPLED MASHUPS <i>Tobias Heger and Heiko Pfeffer</i>	157
SEMANTIC WEB SERVICES: A RESTFUL APPROACH <i>Otávio Freitas Ferreira Filho and Maria Alice Grigas Varella Ferreira</i>	169
CATEGORY-BASED RANKING OF FEDERATED PRODUCT OFFERS <i>Maximilian Walther, Daniel Schuster, Till Juchheim and Alexander Schill</i>	181
EXPLOITING ONTOLOGIES TO DEPLOY USER-FRIENDLY AND CUSTOMIZED METADATA EDITORS <i>Valentina Bolognini, Angelo Di Iorio, Silvia Duca, Alberto Musetti, Silvio Peroni and Fabio Vitali</i>	189
MEDIA SHARING WEBSITES AND THE US FINANCIAL MARKET <i>Martin Sykora and Marek Panek</i>	197
DESIGNING AND IMPLEMENTING SEMANTIC PERSONAL HEALTH RECORDS <i>Juha Puustjärvi and Leena Puustjärvi</i>	205
SEMANTICALLY ENRICHED INTEGRATION SYSTEM FOR HETEROGENEOUS WEB SERVICES <i>Yan Leng, Mahmoud El-Gayyar and Serge Shumilov</i>	213

INTERACTIVE OMNI-FUNCTIONAL DISTRIBUTED DOCUMENTS FOR THE SEMANTIC WEB <i>Joseph Pally and Salih Yurttas</i>	221
ACHIEVEMENT TEST ITEMS EVALUATION WITH THE HELP OF CORRECTNESS COEFFICIENT <i>Tomas Foltyněk, Jana Andryšková, Arnost Motyčka and Magdalena Rázková</i>	229
LEARNING OBJECTS RETRIEVAL FROM CONTEXTUAL ANALYSIS OF USER PREFERENCES TO ENHANCE E-LEARNING PERSONALIZATION <i>Luciana A Martinez Zaina and Graça Bressan</i>	237
DEALING WITH HETEROGENEOUS SEGMENTS OF LEARNING OBJECTS <i>Edmar Wellington Oliveira, Sean Wolfgang M. Siqueira, Maria Helena L. B. Braz and Rubens Nascimento Melo</i>	245
A WEB 2.0 BASED ENVIRONMENT FOR SIMULATION ACTIVITIES IN CONSTRUCTIVIST MEDICAL EDUCATION <i>Eduardo Felipe Zambom Santana, Antonio Francisco do Prado, Wanderley Lopes de Souza and Luiz Henrique Zambom Santana</i>	253
PROSPECTIVE TEACHERS' AWARENESS OF COLLABORATIVE WEB 2.0 TOOLS <i>Yasemin Koçak Usluel, Sacide Güzin Mazman and Arda Arkan</i>	261
LEARNING CULTURE 2.0 – THE ROLE OF RESISTANCE IN CHANGING THE LEARNING CULTURE IN EDUCATIONAL ORGANISATIONS <i>Thomas Berger</i>	269
A DEPENDENCY MODEL FOR COMPOSITE SERVICE MANAGEMENT <i>Matthias Winkler, Christian Sell, Thomas Springer and Alexander Schill</i>	278
DYNAMIC COMPLEX WEB SERVICE BASED ON FUZZY LOGIC SELECTION ALGORITHM <i>Dalibor Ilievski, Marjan Arsic and Danco Davcev</i>	287
AN APPROACH TO BUILDING PROFILE BASED ON THE UTILITY OF FEATURES IN THE ADAPTIVE SYSTEMS <i>Thi-Huyen Le, Duc-Long Le, An-Te Nguyen and Dinh-Thuc Nguyen</i>	295
USABILITY AND E-LEARNING: MOODLE ASSESSMENT <i>Marília Abrahão Amaral and Camila Michele de Almeida</i>	303
EXPERT SYSTEM FOR DIAGNOSING COGNITIVE LEARNING STYLES APPLIED TO DISTANCE EDUCATION STUDENTS <i>Patricia Mariotto Mozzaquatro, Fábio Teixeira Franciscato, Patric da Silva Ribeiro and Roseclea Duarte Medina</i>	311
A SELF DIAGNOSING AND PRESCRIBING E-LEARNING SYSTEM <i>Azita Bahrami</i>	319
HEURISTICS FOR SUPPORTING SOCIAL INTERACTION IN ONLINE COMMUNITIES <i>Sanna Malinen</i>	327

EXAMINING THE ROLE OF TASKS IN USABILITY TESTING FOR DYNAMIC WEBSITES	335
<i>Majed Alshamari and Pam Mayhew</i>	
INDISPENSABILITY OF MOBILE PHONES: AN EXPERIMENTAL COMPARISON TO INTERNET AND TV.	342
<i>Otto Petrovic, Elisabeth Platzer, Emanuel Maxl and Wolf Rauch</i>	
GWIDO - GAMES WITH INTERACTION DESIGN OBJECTIVE	351

GROUP DECISION MAKING IN AN ONLINE GROUP-BUYING COMMUNITY: A CASE STUDY OF THE “IHERGO” ONLINE COMMUNITY <i>Wei-Ting Wang and Lola C.P.Chen</i>	453
TEMPORAL ANALYSIS OF SELLING STRATEGIES IN ELECTRONIC MARKETS <i>Adriano Pereira, Diego Duarte, Sara Guimarães and Wagner Meira Jr.</i>	461
EXPLORING BUSINESS OPPORTUNITIES IN UBIQUITOUS ENVIRONMENTS <i>Laerte Franco, João Rosa, Jorge Barbosa, Cristiano Costa and Adenauer C. Yamin</i>	469
ADAPTIVE MIDDLEWARE FOR INTELLIGENT, CONTEXT SENSITIVE APPLICATIONS <i>Sanja Vranes and Jovan Dudukovic</i>	477
A LIGHTWEIGHT DNS SECURITY SCHEME USING LIMITED-USE KEY GENERATION AND DISTRIBUTION <i>Surakarn Duangphasuk, Nawara Woradej and Supakorn Kungpisan</i>	485
IMPROVING NETWORK PERFORMANCE IN MOBILE COMPUTING SYSTEMS USING THE CODA FILE SYSTEM <i>Temidayo Ogunniyi and Elmarie Biermann</i>	493
THE IMPACT OF INTERNET USERS’ PRIVACY CONCERNS ON TRUST IN E-COMMERCE <i>Patraporn Denpaisarn, Mathupayas Thongmak and Atcharawan Ngarmyarn</i>	501
INTRODUCING HIGH LEVEL API FOR TLS DUAL STACK, BASED ON TLS SMART CARDS <i>Pascal Urien</i>	509
“TRUST ON THE WEB: A MODEL FOR ONLINE DISCUSSIONS” <i>Ioannis Pagkalos and Mark J. Weal</i>	519
USER QUERY BEHAVIOR: IMPLICATIONS FOR THE DESIGN OF IMAGE RETRIEVAL SYSTEMS <i>Ya-Xi Chen</i>	527
FINDING SIMILAR MUSIC ARTISTS FOR RECOMMENDATION <i>Lisa Wiyartanti and Laehyun Kim</i>	535
REGULAR LANGUAGE INFERENCE FOR DOMAIN-SPECIFIC NAMED ENTITY RECOGNITION <i>Falk Brauer, Robert Rieger, Wojciech Barczynski and Adrian Mocan</i>	543
A GENERAL FRAMEWORK FOR DIGITAL IMAGE RETRIEVAL USING SHAPE- RADON TRANSFORMATION <i>Rerkchai Foopratepsiri and Werasak Kurutach</i>	551
XML DOCUMENTS CLUSTERING BASED ON STRUCTURAL SIMILARITY <i>Ali Aitelhadj, Fatiha Souam and Mohamed Mezghiche</i>	559
TOWARDS A COMPONENT AND SERVICE MARKETPLACE WITH BRECHÓ LIBRARY <i>Cláudia Werner, Leonardo Murta, Anderson Marinho, Rodrigo Santos and Marlon Silva</i>	567
SPECTRAL WEB CONTENT TREND ANALYSIS <i>Andreas Juffinger, Reinhard Willfort, Elisabeth Lex and Michael Granitzer</i>	575

WEB CRAWLER PROFILING AND CONTAINMENT THROUGH NAVIGATION PATTERN MINING <i>Anália Lourenço and Orlando Belo</i>	583
ENHANCING BUSINESS INTELLIGENCE ENVIRONMENT WITH ONTOLOGIES <i>Carlos Eduardo Portela Serra de Castro, Sean Wolfgang Matsui Siqueira, Maria Helena Lima Baptista Braz and Rubens Nascimento Melo</i>	591
AUTOMATED BLOG CLASSIFICATION: A CROSS DOMAIN APPROACH <i>Elisabeth Lex, Christin Seifert, Michael Granitzer and Andreas Juffinger</i>	598
MINING THE MOST K-FREQUENT ITEMSETS WITH TS-TREE <i>Savo Tomović and Predrag Stanišić</i>	606

AUTHOR INDEX

FOREWORD

These proceedings contain the papers and posters of the IADIS International Conference WWW/Internet 2009, which was organised by the International Association for Development of the Information Society, in Rome, Italy, 19-22 November 2009.

The IADIS WWW/Internet 2009 Conference aims to address the main issues of concern within WWW/Internet. WWW and Internet had a huge development in recent years. Aspects of concern are no longer just technical anymore but other aspects have aroused. This conference aims to cover both technological as well as non-technological issues related to these developments

The purpose of this conference is to serve as a forum to gather researchers, practitioners, students and anyone who works or studies the field of WWW/Internet.

Submissions were accepted under the following main tracks and topics:

- Web 2.0
 - Collaborative Systems
 - Social Networks
 - • Folksonomies
 - • Enterprise Wikis and Blogging
 - • Mashups and Web Programming
 - • Tagging and User Rating Systems
 - • Citizen Journalism

- Semantic Web and XML
 - Semantics Web Architectures
 - Semantic Web Middleware
 - Semantic Web Services
 - Semantic Web Agents
 - Ontologies
 - Applications of Semantic Web
 - Semantic Web Data Management
 - Information Retrieval in Semantic Web

- Applications and Uses
 - e-Learning
 - e-Commerce / e-Business
 - e-Government
 - e-Health
 - e-Procurement
 - e-Society
 - Digital Libraries
 - Web Services/SaaS
 - Application Interoperability
 - Web-based multimedia technologies

- Services, Architectures and Web Development
 - Wireless Web
 - Mobile Web
 - Cloud/Grid Computing
 - Web Metrics
 - Web Standards
 - Internet Architectures
 - Network Algorithms
 - Network Architectures
 - Network Computing
 - Network Management
 - Network Performance
 - Content Delivery Technologies
 - Protocols and Standards
 - Traffic Models
- Research Issues
 - Web Science
 - Digital Rights Management
 - Bioinformatics
 - Human Computer Interaction and Usability
 - Web Security and Privacy
 - Online Trust and Reputation Systems
 - Data Mining
 - Information Retrieval
 - Search Engine Optimization

The IADIS WWW/Internet 2009 Conference had 347 submissions from more than 44 countries. Each submission has been anonymously reviewed by an average of four independent reviewers, to ensure the final high standard of the accepted submissions. The final result was the approval of 75 full papers, which means that the acceptance rate was below 22%. A few more papers have been accepted as short papers, reflection papers and posters. Best papers will be selected for publishing as extended versions in the *IADIS International Journal on WWW/Internet (IJWI)* and in other selected journals.

The conference, besides the presentation of full papers, short papers, reflection papers, posters and doctoral consortium presentations also included a keynote presentation talk from an internationally distinguished researcher. We would like also to express our gratitude to Professor Daniel Schwabe, Department of Informatics, Catholic University in Rio de Janeiro (PUC-Rio), Brazil, for being our keynote speaker.

As we all know, organising a conference requires the effort of many individuals. We would like to thank all members of the Program Committee for their hard work in reviewing and selecting the papers that appear in the proceedings.

This volume has taken shape as a result of the contributions from a number of individuals. We are grateful to all authors who have submitted their papers to enrich the conference proceedings.

Each of the Proceeding books contains a rich experience of the academic & research institutions and the industry on diverse themes related to the Internet and Web. We do hope that researchers, knowledge workers and innovators both in academia and the industry will find it a valuable reference material.

Last but not the least, we hope that everybody will have a good time in Rome and we invite all participants for the next year edition of the *IADIS International Conference WWW/Internet 2010*.

Paseo de la Universidad, 4 – 13071 Ciudad Real, España*

ABSTRACT

Providing data with an adequate level of quality, especially for Internet applications (e.g. Web Portals), has been increasingly becoming a very important issue for organizations, because data is a strategic asset for making decisions, or concretizing business. We posit that the raising and assurance of adequate levels of quality for data must be taken into account from the earliest phases of software development. To achieve this goal, we propose to introduce specific data quality requirements as new software requirements, more specific for Web Portals ones. For this goal, we have depicted a strategy consisting on identifying and integrating requirements corresponding to functionalities of Web Portals for the different kind of users (viewpoints), and their specific Data Quality requirements, for developing software enable to manage data with the adequate level of quality. To simplify the underlying complexity, in this paper we present a methodology based on viewpoints, DQ-VORD, which can be used to guide developers to build Data Quality aware - Web Portals.

KEYWORDS

Data Quality, Requirements Elicitation, Portal Web.

1. INTRODUCTION

Over the last years, the number of organizations which have developed Web Portals has grown considerably. The Internet allows easily collecting and sharing data between users (B2C), or between organizations (B2B). In addition, Web Portals provide users with access to different data sources (Mahdavi et al., 2004), as well as to other on-line information and information-related services (Yang et al., 2004). Web Portals also create a suitable working environment for users easily to navigate to find data they actually need to perform their operational or strategic functions (Collins, 2001).

However, problems due to inadequate levels of data quality (DQ) can make ineffective such kind of applications. These problems have caused a negative impact that has an important cost (and not only in economic terms), but also social for the organizations (Eppler and Helfert, 2004) (Laudon, 1986). See for instance, those scenarios identified by Levis in (Levis et al., 2007): ill-defined process, untrained information producer as well as defective data design, redundant databases and defective application design.

Problems due to inadequate levels of DQ can be addressed according to their nature (Caballero et al., 2008a) in the following groups: (1) *Technical* (such as those relating to the implementation of data warehouses (Oliveira et al., 2005)). (2) *Organizational* (such as loss of customers (Redman, 2000), large financial losses (Cai and Shankaranarayanan, 2007) (Eppler and Helfert, 2004) or even dissatisfaction of workers (English, 1999) (Strong et al., 1997a)). (3) *Legal*, because of privacy and/or national legislation (like the Spanish Organic Law for Data Protection from 1999).

As the common trend to think about DQ as errors in data stored in databases fails to resolve complex organizational problems (Strong et al., 1997b), the concept of data quality should not be longer understood only as “zero defects” in the data, but “*fitness for use*” of data. Due to this, it should be kept in mind the importance of users performing a role, because they are the ones who lastly determine the degree of fitness for use of the data they are using: they have the perception of the actual level of quality of the data for each task that they are carrying out. It is a matter of trust on data: if data has enough quality, users would better

trust on it to carry out their tasks. For such tasks, users utilize certain tools software, as web applications or Portal Webs (Caballero et al., 2008a). We posit that, given that applications in general, and Portal Webs in particular, are built to satisfy certain business requirements, if they would be designed to also satisfy DQ requirements since earlier phases of their developing, then, it would be possible to assure to organizations and users that problems previously related could be avoided.

The challenge of research question is how to identify and introduce jointly in the Portal Web development the corresponding software requirements for data quality as a new kind of business ones. In addition, as demonstrated by (Wang and Madnick, 1993), these kinds of requirements are transversal to typical functional requirements, what makes even more complex the related DQ management requirement within a software development project. In order to minimize this complexity when dealing DQ requirements, we thought that some researching in order to develop artifacts which make easier the work is required.

After delving into the related bibliography looking for approaches to our researching question, we have only found few proposals, like the one in (Wang and Madnick, 1993) for the relational model, or that one related to semantics technologies in (Caballero et al., 2008b) or (Missier et al., 2006), but not ones related to deal with DQ management requirements in software development. Due to this reason, we designed a two-step researching strategy aimed at discovering how to specify DQ requirements that could avoid the identified DQ problems for Information Systems as described by (Strong et al., 1997a) to the specific functionalities of a Web Portal, as described by (Collins, 2001).

To achieve this goal, our first step is to list a generic set of DQ requirements coming trying to fulfill those DQ issues. Bearing in mind the idea of “*fitness for use*”, one can suspects that these requirements strongly depend on both the nature of the domain, and the user performing actions with Web Portals functionalities. These suspicions have made that our researching efforts are to take into account the various point of views of each kind of user performing an action might have. So, and this is the second step and the main contribution of this paper, is to build a methodology, that we have named as *DQ-VORD*, and which it is based on VORD (Viewpoints Oriented Requirements Definition (Kotonya and Sommerville, 1996)) aimed to identify, elicit and integrate both kind of requirements for Web portal development: those addressing functionalities (typical software requirements), and those ones oriented to DQ management.

The remainder of the paper is structured as follows: Section 2 reviews the three pillars in which our proposal is based: the one regarding to data and information quality measurement (as an important part of DQ management), the one regarding to functionalities of a Portal Web, and the VORD method. In order to manage a standard knowledge, for the description of the DQ foundations, we will align our explanations to the just-released (ISO-25012, 2008), the international standard for data quality. Section 3 presents our proposal: firstly the list of DQ requirements and secondly, the methodology DQ-VORD. Finally in Section 4, we review some conclusions and future work.

2. RELATED LITERATURE

2.1 Data Quality Measurement

In order to reduce the negative impact of problems (technical, organizational or legal) of inadequate levels of DQ, it is essential that companies can have a quantitative perception of their actual importance. So, they must assess how good their organizational data resources are for the tasks at hand. This firstly involves the definition of representative DQ measures and corresponding measurement procedures on the data, and secondly the establishment of some valid acceptance ranges for these measurements (Caballero et al., 2008a). With this assessment, users could discriminate those pieces of data which are not good enough for their own use. The DQ is recognized to be a multidimensional concept: for measuring the level of DQ of a piece of data, it is necessary to identify several DQ dimensions (known the set as “DQ model”) (Lee et al., 2006) that characterize DQ requirements. Although there exists many DQ models most of them are quite domain dependant, which diminishes their applicability. In order to get a broader perspective as possible, we have chosen for our research the generic DQ model proposed in the recently released DQ standard ISO/IEC 25012 (ISO-25012, 2008). This standard brings together fifteen DQ dimensions from two points of view:

- *Inherent*: refers to the extent to which quality characteristics of data have the intrinsic potential to satisfy stated and implied needs when data is used under specified conditions.
- *System dependent*: refers to the extent to which data quality is reached and preserved within a computer system when data is used under specified conditions.

The DQ dimensions contained in the standard ISO/IEC 25012 (ISO-25012, 2008) are: *Accuracy, Completeness, Consistency, Credibility, Currentness, Accessibility, Compliance, Confidentiality, Efficiency, Precision, Traceability, Understandability, Availability, Portability and Recoverability*. Ensuring that the data managed by the functionalities fulfills the DQ dimensions selected of the model, is a way to enunciate a DQ Requirement for Web Portal developers. In section 3.1, we will discuss about which DQ dimensions can be associated to each one of the Web Portal functionalities.

2.2 Web Portal Functionalities

As previously mentioned, our first step is associate the relationships between Web portal functionalities and those DQ dimensions which would best represent the various roles' DQ requirements. So, we must first enumerate and review these functionalities as described by (Collins, 2001). We have reordered them taking as criterion the following: "*the greater probability of utilization of a functionality of a Portal Web, the greater probability of being susceptible of finding inadequate levels of DQ*". It is necessary to highlight that the proposed order is determined in base to our experience and knowledge in both data quality and web development area. Table 1 shows the ordered list of functionalities with a small comment from the developer point of view.

Table 1. Web portal functionalities (Collins, 2001)

Functionalities	Description
Content Management	This function supports content creation, authorization, and inclusion in (or exclusion from) Web Portal collections. The organizations have information and reference material that is available from the Web Portal.
Process and actions	This function enables Web Portal users to initiate and participate in an organizational business process.
Search capabilities	These provide Web Portal users with several services for supporting searches throughout the company, the World Wide Web, and/or in search engine catalogs and indexes.
Administration	This functionality provides two kinds of services: the first one corresponding to maintenance activities and using task associated with the portal web system. The second one, a service that can be configured only for the administrator with the Web Portal system, as well as every user through of the personalization.
Security	This provides a description for the levels of access that each user or groups of users are allowed for each portal application and software function included in the Web Portal.
Data points and integration	These provides the ability to access information from a wide range of internal and external information sources and display the resulting information on the single point-of-access desktop.
Communication and collaboration	This functionality facilitates discussion, the location of innovative ideas, and the recognition of enterprising solutions. These elements allow the employees to work together in a more productive way by means of the creation of a shared virtual environment (contribution), bearing electronic messaging (communication) and adding characteristics of communication and contribution to the process of business (coordination).
Presentation	This provides Web Portal users with the visual experience that encapsulates all the functionalities of the portal.
Taxonomy	This provides the context of information, including the organization-specific categories that reflect and support the organizational business. It provides common terminology used in the organization of fast recognition and improvement the semantic for the users of the portal.
Personalization	This is a critical component when creating a working environment that is organized and configured specifically for each user in the company. The key is achieves a balance between the information and the attributes needed to be consistent and constant in the personalization of the portal, and the unique characteristics required for each employee.
Help features	These provide with help when using the Web Portal. The aid should be referred to the characteristics of the portal and to specific characteristics of the organization.

2.3 Requirements Definition

Requirement Engineering is a systematic process of developing requirements through a joint and iterative process of analysis of the problem, documenting the resultant observations in a representation formats variety, and verifying the precision of the earned understanding (Loucopoulos and Karakostas, 1995). The viewpoint-oriented approach for the Requirements Engineering takes into consideration the different viewpoints of the different roles to structure and organize the requirement elicitation process. The key point of the viewpoint-oriented analysis takes into account the existence of several perspectives and provides a framework to discover conflicts between the requirements proposed by different viewpoints. The viewpoint can be used as a form to classify the stakeholders.

There are three kinds of generic viewpoints (Sommerville, 2000): (1) *Direct viewpoints*: they represent people and other systems that interact with the system directly. This kind of viewpoints can give detailed requirements of the system that cover the characteristics, functionalities and interfaces of the system. (2) *Indirect viewpoints*: they represent those stakeholders having interest in some or all of the services which are delivered by the system, but do not interact directly with it. Is more probable they are able to provide organizational requirements and restrictions of high level. (3) *Domain viewpoints*: they represent the characteristics and restrictions of the domain that have influence in the system requirements.

Sometimes, the initial identification of the relevant viewpoints of a system may be difficult. Analyst should try to identify types of viewpoints in a more specific way (Sommerville, 2000). For any not trivial system, an enormous amount of possible viewpoints can exist, and it could be practically impossible to obtain a full and complete list of requirements for all of them. Therefore, it is important to organize and to structure the viewpoints hierarchically according to their criticalness/priority degree, because likely, different viewpoints in the same branch can share common requirements.

The VORD (*Viewpoints-Oriented Requirements Definition*) method (Kotonya and Sommerville, 1996) has been designed to guide the process of elicitation and analysis of requirements. The main steps of this method are described in Table 2.

Table 2. Main steps of VORD method

Steps	Description
1. VI-1. Viewpoints Identification	That implies to discover the ones that receive the functionalities or services of the system, and identify the specific functionalities that supply to each viewpoint.
2. VS-2. Viewpoints Structuring	That encompasses to classify the viewpoints previously obtained into a hierarchy. The common functionalities are located in the high levels of the hierarchy and the viewpoints of low level are inherited.
3. VD-3. Viewpoints Documentation	Which consist of documenting the viewpoint name, requirements, constraints on its requirement and its source. Viewpoint requirements include a set of required services, control requirements and set of non-functional requirements.
4. VL-4. Viewpoints Layout	That encompasses to identify the objects in an object oriented design utilizing the information of the service encapsulated in the viewpoint.

3. DQ-VORD: A METHODOLOGY FOR THE ELICITATION OF DQ REQUIREMENTS FOR WEB PORTALS DEVELOPMENT

In this section we show the current state of our work. Firstly, we show the results of the analysis carried out after mapping the DQ dimensions to the different Web Portal functionalities. After this, the DQ-VORD methodology for the definition of DQ requirements is explained.

3.1 Mapping DQ Dimensions to Web Portal Functionalities

Once described in section 2.1 the meaning of the most important DQ dimension and listed the functionalities for a Web Portal in section 2.2, we are going to carry out a mapping between the DQ dimensions and the functionalities. Considering this mapping in the moment to development each functionality, it would be possible ensuring that the data that will be stored and manipulated by the functionalities have an acceptable quality level. Therefore, it is necessary to describe the DQ Requirements that can be drawn to avoid or at

least minimize the effect of the problems described by (Strong et al., 1997a). In this sense, the main challenge consists of not only making the mapping, but also discovering how these DQ dimensions can be observed and implemented for each one of the functionalities since the point of view of each role. We have extended the first mapping that Caro et al. performed in (Caro et al., 2008), where a classification of Web Portal Functionalities vs. data quality attributes was carried out according to the data quality model defined by (Strong et al., 1997b). For future developers' convenience, we have rather preferred to align them in our research to the standard ISO/IEC (ISO-25012, 2008). For doing so, we first analyzed each one of the DQ dimensions defined by (Strong et al., 1997b), and we have compared their meaning to those provided by the ISO standard. In this way, we have adapted the "DQ Attributes" axis of the table provided by (Caro et al., 2008) to the new DQ dimensions mentioned in the standard ISO (the mark "X" in Table 3 shows that relationships).

In addition, to the obtained results from our analysis, we have included the remainder of relationships between DQ dimensions provided by the standard ISO and the Web Portal functionalities. As result, the sign "O" represents our new findings. With this mapping, what we intend is to determine a roadmap that analysts can follow to write a Requirement Specification Document, always keeping in mind the DQ dimensions that should be implemented for each functionality. Table 3 shows the whole results of this mapping.

After obtaining an initial set of DQ dimensions that are potentially applicable to the evaluation of DQ in the context of a Web Portal, and in order to gain clarity, below, we describe every one of these new relations signed with the mark "O" (Web Portal Functionalities, DQ dimensions) in Table 4.

Table 3. Relationships between DQ dimensions and Web portal functionalities

DQ dimensions	Accuracy	Completeness	Consistency	Credibility	Currentness	Accessibility	Compliance	Confidentiality	Efficiency	Precision	Traceability	Understandability	Availability	Portability	Recoverability
Data points and Integration	X	X	X	X	X				X			X	O		
Taxonomy	O		X	X	X				X			X			
Search capabilities	X	X	X	X	X				X		O	X	O		
Help features			X				X					X			
Content Management	X	X	X	X	X	X	X	O	X		O	X		O	
Process and Action	X	X	X	X	X	X	X		X			X			
Collaboration and Communication	O		X	O	O	X						X	O		
Personalization	X	X			X	X							O		
Presentation	X	X	X	X	X				X			X			
Administration			X			X	O		O	O		X		O	O
Security	X	X	X		X	X		O			O	X			

3.2 DQ-VORD Methodology

The second step is to propose a methodology that can guide developers to identify for each one of selected functionalities, those DQ dimensions that must be assured according to our previous analysis. These DQ dimensions are going to be introduced as new software requirements. In this sense, the VORD method could be taken as a reference since it is one of the main methods for requirements definition. The reason for which we have decided to base our work on this "viewpoints oriented" method is that it allows incorporating the aspects of DQ management during the elicitation process. In this way, DQ requirements can be introduced as normal ones, but taking into account the diverse viewpoints of the different kind of users/stakeholders.

The use of viewpoints as a means of organizing and structuring the requirements engineering activity has been demonstrated to be useful in some scenarios (Nuseibeh and Easterbrook, 2000). Viewpoints are based on the entities whose requirements are responsible for, or may constraint, the development of the intended

system. Different kinds of stakeholders can provide their specific requirements from their own point of view. In this sense, each of the stakeholder proposing requirements is known as “requirements sources”. Each requirements source (*viewpoint*) has a relationship with the proposed system based upon its needs and interactions with the system to be developed. Therefore, it is important to assure that techniques to be used can adequately capture and organize, not only global but also the specific requirements for the different viewpoints into a cohesive knowledge structure that must be both complete and visible (e.g. domain requirements together with specific DQ requirements).

Table 4. Description of relations between DQ dimensions and web portal functionalities

Web Portal functionalities	DQ dimensions	Description
Data points and Integration	Availability	The data should be always within reach of the users at the moment that are required.
Taxonomy	Accuracy	The data intrinsically should be syntactic and semantically correct, improving the common terminology utilized in the organizations.
Search capabilities	Availability	The data must be recovered at the moment to execute some type of specific search. It implies that the data is accessible, that the access roads are available and the user has the adequate permissions for its reading.
	Traceability	The system should provide information about the quantity of times that a data has been accessed or modified.
	Confidentiality	The data just should be accessible and interpretable by authorized users.
Content Management	Traceability	The data should provide information about when and who published or distributed them and who will be able to access them.
	Portability	The data will be able to be installed or moved inside any system in the organization.
	Accuracy	The data should be used and understood in the same context for all users (employees), to improve the communication and performance of them.
Collaboration and Communication	Credibility	The data must be considered as truthful by all users, to improve the collaboration among each one.
	Currentness	The data must be updated, helping to carry out creative solutions and innovated in the business process.
Personalization	Availability	The data should be available to the authorized users, to help them to discuss and resolve problems, as well as make decisions.
	Compliance	The data should be available to the authorized users, creating a work environment configured especially for each employee.
	Efficiency	The data should be adhered to norms or conventions defined by the organization.
Administration	Precision	The data can be accessed with an adequate level of operation.
	Portability	The data should be defined accord to the required precision.
	Recoverability	The data will be able to be installed or substituted by the Administrator of the portal during activities of maintenance. The data will be able to be maintained and recovered by the administrator of the portal during activities of maintenance, or in case of some type of failure of the system.
Security	Confidentiality	The data will be just accessed by authorized users.
	Traceability	The data will give information about when and who used them.

Descriptions of the stages of *DQ-VORD* methodology, mapped from those one from VORD, as well as its subactivities, its input and output products, and techniques/tools related will be next shown.

1. *IWPV. Identification of the Web Portal Viewpoints.* This stage is analogous to the step VI-1 of the VORD method (see Table 2). It implies to discover the different viewpoints that will receive the functionalities of the Web Portal, besides the identification of the Web Portal functionalities together with the DQ dimensions associated (see Table 5).
2. *VS. Viewpoints Structuring.* It encompasses to group the viewpoints related in a hierarchy. The main functionalities are located in the high levels of the hierarchy and are inherited to the viewpoints of low level, besides the DQ dimensions are hierarchize in the same context (see Table 6).
3. *DV .Documentation of the Viewpoints.* It encompasses to refine the description of the viewpoints and the functionalities identified, adding the DQ dimensions (see Table 7).

Table 5. Artefacts and subactivities for the IWPV

<i>IWPV.1. Identification of the Web Portal Functionalities (IWPF) to be implemented</i> , it implies to identify the specific functionalities that are provided to each viewpoint.	
Input Product	- List of identified viewpoints being able to propose software requirements for the system. - List of all Web Portal functionalities ((Collins, 2001)).
Output Product	- List of chosen functionalities for satisfying requirements of each viewpoint.
Tools and techniques	- Interviews - Study of documentation - Questionnaire - Brainstorming
<i>IWPV.2. Identification of the Data Quality Dimensions (IDQD)</i> , it implies to identify the different DQ dimensions related to each one of the functionalities described for each viewpoint, taking as base the matrix of the Table 3.	
Input Product	- List of viewpoints identified being able to propose DQ requirement for the system. - List of chosen functionalities for satisfying requirements of each viewpoint. - List of DQ dimensions (mapped in section 3.1) for each functionality.
Output Product	- List of DQ dimensions associated to the different functionalities. - Document of System Requirements Specification.
Tools and techniques	- Interviews - Work sessions - Brainstorming

Table 6. Artefacts and subactivity for the VS

<i>VS.1. Classification of Data Quality Dimensions (CDQD)</i> , it consists of classifying the DQ dimensions according to the hierarchy, in base at the priority level that the Web Portal functionalities have.	
Input Product	- List of viewpoints identified in the system. - List of DQ dimensions associated to the different functionalities.
Output Product	- List of classification of DQ dimensions.
Tools and techniques	- Work sessions - Judgment of experts

Table 7. Artefacts and subactivity for the DV

<i>DV.1. Documentation of the Data Quality Dimensions (DDQD)</i> , it consists of documenting or modeling if possible, the DQ dimensions identified (e.g. through use cases diagram).	
Input Product	- List of classification of data quality dimensions. - Document of System Requirements Specification.
Output Product	- Document of System Requirements Specification augmented with DQ Software Requirements Specification.
Tools and techniques	-Work sessions -Judgment of experts -Tools like Word processors -Modeling tools for UML

4. *LVS. Layout of the Viewpoints of the System*. It encompasses identifying the main objects in an object oriented design using the information of the functionality encapsulated in the viewpoints (see Table 8).

Table 8. Artefacts and subactivities for the LVS

<i>LVS.1. Modeling of the data quality dimensions (MDQD)</i> , it consist of modeling the different DQ dimensions in a data model and later on, in a process model.	
Input Product	- Document of System Requirements Specification augmented with DQ Software Requirements Specification.
Output Product	- Document of high level design with awareness of data quality (data model and process)
Tools and techniques	- Object oriented modeling tools (Rational Rose, Visual Paradigm, Poseidon, ArgoUML)
<i>LVS.2. Validation of Model (VM)</i> , it consists of validating the complete model with the stakeholders.	
Input Product	- Document of System Requirements Specification augmented with DQ Software Requirement. - Document of high level design with awareness of data quality.
Output Product	- Final Document approved of "System Requirements Specification augmented with DQ Software Requirements Specification". - Final Document approved of "High level design with awareness of data quality".
Tools and techniques	- Work sessions - Interpersonal negotiation techniques

4. CONCLUSIONS AND FUTURE WORK

In the last decade, Web portals have established as one of the principal information sources in the Internet, and as means for allowing the access to information for all people. Nevertheless, the great majority of users who seek information through portals, needs to be sure that information has the adequate DQ level for the

required use of data. Ideally we wish to imagine an analyst or designer that, using a single software development tool, can be able to development a complete Web Portal, managing it from the early stages of the development all the requirements (functional, non functional, and DQ related), design, testing, until the automatic generation of code. A first approach to this solution, specifically in the stage of requirements specification is shown in this work, in which it is described which DQ dimensions would be presumably implied directly with the different functionalities of a Web Portal. The paper also shows a proposal of a methodology for the elicitation and management of DQ requirements. In a given moment, both *features* would facilitate to the developers to have awareness of the level of data quality that needs to be implemented for each one of the functionalities during all the Web portal development process.

As part of our future work, we pretend to align our progresses to MDA technologies (*Model Driven Architecture*), since due to its abstraction capabilities and characteristics of modeling, we could assure an easier integration of our findings in DQ aware-Web Portals Development with other tools and methodologies related to Software Development.
